## 1 Scope

Determination of PCB in solid waste materials is subject of standard prEN 15308: 2006-09. It describes the determination of the 7 congeners PCB-28, 52, 101, 118, 138, 153 and 180. Extraction may be performed either by shaking, sonification or by soxhlet extraction. Several methods for clean-up of the extract are described. Final determination is performed by gas chromatography either with an electron capture detector or with a mass selective detector.

The present report describes a collaborative interlaboratory experiment which was performed in order to provide basic data concerning reproducibility and repeatability of the standard mentioned above.

## 2 Summary

Seven typical solid waste materials were investigated in this study: building debris, cable shredder, contaminated soil, electronic waste, sealant waste, shredder light fraction and waste wood. Additionally a PCB standard solution with a certifite concentrations was used for quality assurance purposes. Twenty laboratories took part in this study, representing eight European countries.

A summary of the performance characteristics is given in Table 1.

**Table 1: Summary of performance characteristics of prEN 15308**

### 3 Organisation

- Sponsor:  
German federal states program „water, soil, waste“  
(Länderfinanzierungsprogramm “Wasser, Boden Abfall”)
- Project coordinator:  
Dr. Klaus Furtmann, Landesumweltamt Nordrhein-Westfalen, Düsseldorf/Germany
- Contractor:  
Bayer Industry Services GmbH, Leverkusen/Germany
- Sample materials:  
Members of CEN/TC 292 WG 5

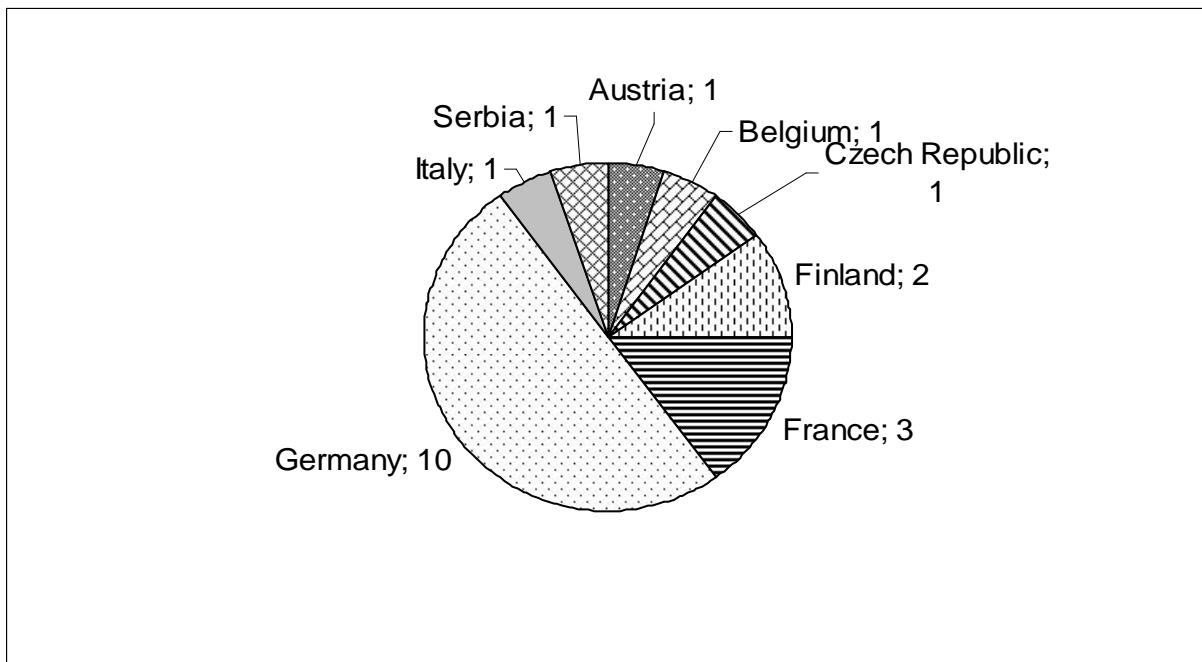

### 4 Time Schedule

November – December, 2006	Collection of samples
November, 2006 – January, 2007	Homogenisation of samples
December, 2006 – January, 2007	Homogenisation testing
February 12, 2007	Start of sample shipping
April 12, 2007	End of experimental phase
April 16 – April 20, 2007	Stability testing
April 27, 2007	Draft report sent to participants

## 5 Participants

In total, 26 laboratories were involved in this study. Results were obtained by 20 laboratories. They represent eight European countries. Details of participating laboratories are given in table 3.

**Figure 1: Number of laboratories by countries**

## 6 Samples

Contaminated soil, building debris, sealant waste and electronic waste were collected by Bayer Industry Services. The other materials were obtained by the sponsor, by Lobbe Entsorgung GmbH and by the Federal Institute for Material Testing and Research. Thanks is expressed to Mrs. A. Nussbaumer and to Mrs. P. Lehnik-Habrink.

### 6.1 Sample preparation

#### 6.1.1 Building debris

The sample was collected from a building on a chemical industrial site. It consisted of parts of concrete, brick and gypsum. The material was crushed in a jaw crusher into particles < 10 mm. After milling in a ball mill the material was sieved again (1 mm) and finally homogenized by shaking in a plastic drum.

#### 6.1.2 Cable shredder

The sample material was grinded with a centrifugal mill (ring sieve 0,50 mm) using liquid nitrogen. The grinding stock was air dried. The material was then sieved. The fraction < 2 mm was taken and homogenized in a plastic drum.

### **6.1.3 Contaminated Soil**

The sample was taken from an old industrial site. In order to achieve the desired concentration it was mixed with non contaminated soil. The homogenized material was air-dried and sieved (5 mm). After milling in a ball mill the material was sieved again (1 mm) and finally homogenized by shaking in a plastic drum.

### **6.1.4 Electronic waste**

Boards from different electronic devices were crushed manually into smaller pieces and grinded using a cutting mill. Two subsequent milling processes with sieves of 5 and 2 mm were performed. After sieving (1 mm), the material was ginded again with a centrifugal mill (ring sieve 0,75 mm) and finally homogenized in a plastic drum.

### **6.1.5 Sealant waste**

This sample was collected from windows in a public school. In order to achieve the desired concentration the material was mixed with non contaminated samples. The mixture consisted of sealants based on silicone and polyacryl polymers. The sample was grinded with a cutting mill using liquid nitrogen. Three subsequent milling processes with sieves of 5, 2 and 1 mm were performed. The material was finally homogenized in a plastic drum.

### **6.1.6 Shredder light fraction**

This material is a fraction of waste from used devices and vehicles. Typically it consists of 25 - 35% plastics, 20 - 30% elastomers, 10 - 16% glass 3 - 5% lacquers 3 - 6% textiles 3 - 6% wood/fibrous materials, 0.5 - 4% alumina, 1 - 3% copper, 3 - 13% iron 10 - 20% soil material and street dirt. The material was grinded using a cutting mill. The material was then sieved. The fraction < 1 mm was taken and homogenized in a plastic drum.

### **6.1.7 Standard solution**

Commercially available solutions of 7 PCB congeners in iso-octane were mixed and diluted to the desired concentrations with cyclohexane. The concentration of the individual congeners was in the range of 0.2 to 1.2 µg/ml.

### **6.1.8 Waste wood**

After grinding using a cutting mill two subsequent milling processes with sieves of 2 and 1 mm were performed in order to obtain visually homogenous material. In order to achieve the desired concentration the material was spiked with an extract of contaminated soil in acetone. After air-drying, the material was homogenized in a plastic drum.

## 7 Homogeneity and stability

In-bottle homogeneity of samples was tested by 8 repeated analyses from one sample container. For investigation of homogeneity of bottles, 8 repeated analyses from different sample vessels were performed. Data for homogeneity testing are given in table 4.

Stability of samples was tested at the end of the experimental part of the study. Results showed that all analytes were sufficiently stable.

## 8 Shipping of samples

After homogenisation, samples were filled into screw cap brown glass bottles with a volume of 50 ml or 100 ml. Typically, each glass bottle contained about 25 or 55 g. Samples were shipped to the laboratories by truck or by air mail.

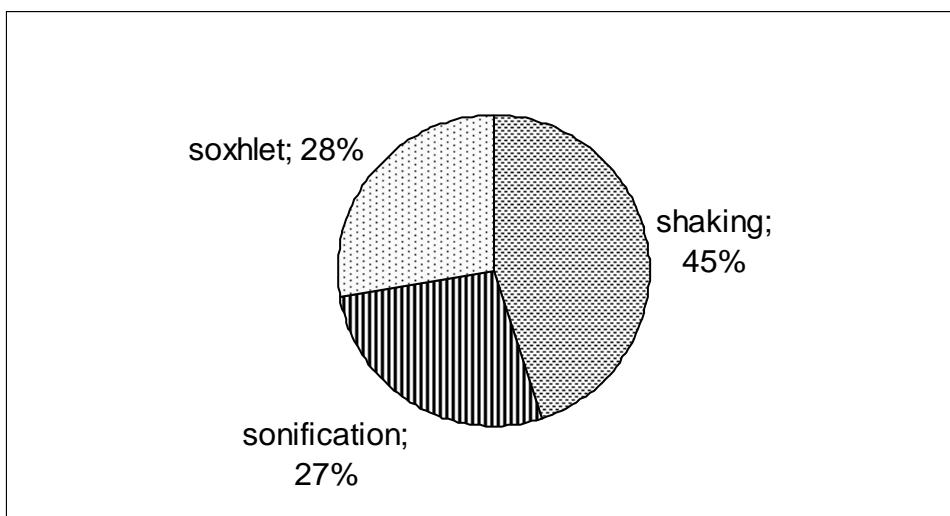

## 9 Analysis of samples

The laboratories were informed about the expected concentration range of the sum of 7 PCB. Additionally they were instructed about special requirement on sample handling e.g. type of extraction solvent. The samples were analyzed according to prEN 15308 (September 2006). On a reply sheet, laboratories were asked to describe details on the analyses e.g. type of sample extraction, clean-up and detector.

### 9.1 Extraction

The standard prEN 15308 describes three possibilities for extraction: soxhlet extraction, extraction by shaking and by sonification. Figure 2 shows the percentage of extraction procedures used by the participants.

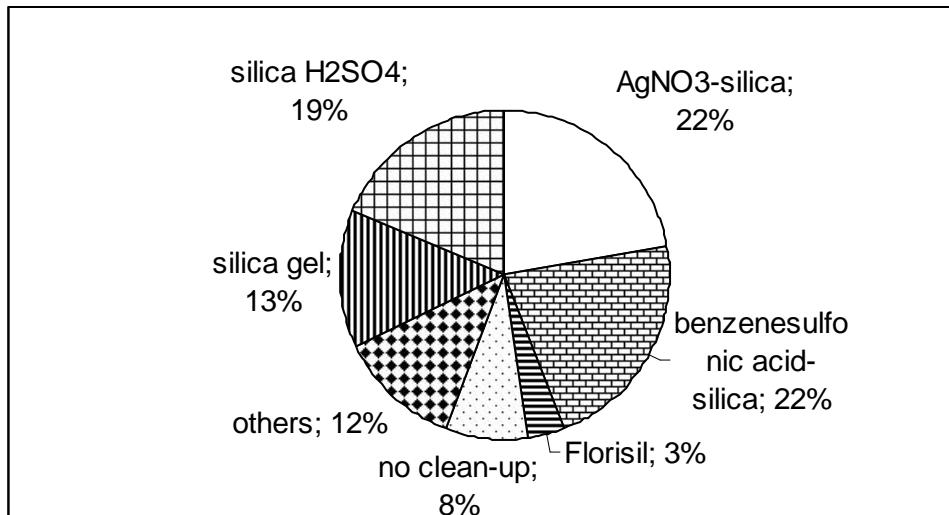

**Figure 2: Extraction prodecures used by participants**

## 9.2 Clean-up

The standard prEN 15308 describes several possibilities for clean-up: AgNO<sub>3</sub>-silica, benzenesulfonic acid-silica, Florisil, silica gel, silica H<sub>2</sub>SO<sub>4</sub> or no clean-up. Figure 3 shows the percentage of clean-up procedures used by the participants.

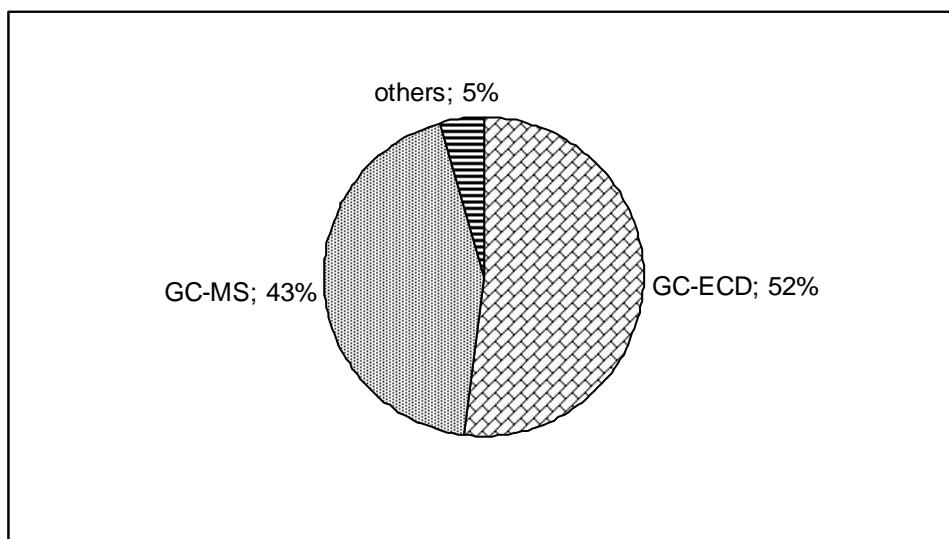

**Figure 3: Clean-up prodecures used by participants**

## 9.3 Detection

The standard prEN 15308 describes two possible GC detectors: mass spectrometry (GC-MS) and electron capture detector (GC-ECD). Figure 4 shows the percentage of detectors used by the participants.

**Figure 4: Extraction prodecures used by participants**

## 10 Data Evaluation

### 10.1 Expert Judgement

Prior to calculations, all results were checked for plausibility. Some laboratory managers were contacted and asked to re-examine their data. In some cases data were corrected.

In a second step the results were checked for completeness. Repeatability standard deviation can only be calculated if more than 1 result is reported by the laboratory. For this reason, all single results were excluded and not used for further calculations. This was the case for lab no. 2 (electronic waste) and lab no. 5 partially, 21 and 25 (cable shredder).

### 10.2 Calculations

Original laboratory results were evaluated according to DIN ISO 5725-2:2002-12. A commercial software package (ProLab; QuoData Gesellschaft für Qualitätsmanagement und Statistik mbH) was used for calculations and graphical data presentation. Result below the limit of determination are not used for calculation.

According to DIN ISO 5725-2, two types of outliers (according to Grubbs and according to Cochran) were identified. An outlier according to Grubbs indicates a strong deviation of the laboratory mean value from the overall mean value.

An outlier according to Cochran indicates a strong deviation of the in-laboratory repeatability standard deviation with respect to the overall repeatability standard deviation. The type of outlier is marked in Table 5 as well as in the graphical presentation (G = Grubbs, C = Cochran).

### 10.3 Quality Assurance

A standard solution of known reference concentrations of 7 PCB congeners was analysed by the participants. Table 2 shows the overall mean values with respect to the reference values.

**Table 2: Analytical results of standard solution**

	mean value µg/ml	reproducibility standard deviation µg/ml	reference concentration µg/ml
PCB 28	0.191	0.031	0.200
